

ECON 133 – Securities Markets – FALL 2010, UCSC
HOMEWORK # 3 AK

1. $E(r) = 20\% \cdot (-5\%) + 20\% \cdot 10\% + 60\% \cdot 20\% = 13\%$
 $SD = [20\% \cdot (-5\% - 13\%)^2 + 20\% \cdot (10\% - 13\%)^2 + 60\% \cdot (20\% - 13\%)^2]^{0.5} = 9.8\%$
2. Sharpe ratio $= (13\% - 5\%) / 9.8\% = 0.82$

3. $E(r) = 75\% \cdot 13\% + 25\% \cdot 5\% = 11\%$
 $SD = 75\% \cdot 9.8\% = 7.35\%$
4. $E(r) = 125\% \cdot 13\% - 25\% \cdot 7\% = 14.5\%$
 $SD = 125\% \cdot 9.8\% = 12.25\%$
5. $12\% = y \cdot 13\% + (1-y) \cdot 5\%$, $y = 7/8$
 $SD = 9.8\% \cdot 7/8 = 8.6\%$
6. $8\% = y \cdot 9.8\%$, $y = 81.6\%$
 $E(r) = 81.6\% \cdot 13\% + (1 - 81.6\%) \cdot 5\% = 11.5\%$
7.
 - a. Subscript OP refers to the original portfolio, ABC to the new stock, and NP to the new portfolio.

$$\text{i. } E(r_{NP}) = w_{OP} E(r_{OP}) + w_{ABC} E(r_{ABC}) = (0.9 \times 0.67) + (0.1 \times 1.25) = 0.728\%$$

$$\text{ii. } \text{Cov} = r \times \sigma_{OP} \times \sigma_{ABC} = 0.40 \times 2.37 \times 2.95 = 2.7966 \cong 2.80$$

$$\begin{aligned} \text{iii. } \sigma_{NP} &= [w_{OP}^2 \sigma_{OP}^2 + w_{ABC}^2 \sigma_{ABC}^2 + 2 w_{OP} w_{ABC} (\text{Cov}_{OP, ABC})]^{1/2} \\ &= [(0.9^2 \times 2.37^2) + (0.1^2 \times 2.95^2) + (2 \times 0.9 \times 0.1 \times 2.80)]^{1/2} \\ &= 2.2673\% \cong 2.27\% \end{aligned}$$

b. Subscript OP refers to the original portfolio, GS to government securities, and NP to the new portfolio.

i. $E(r_{NP}) = w_{OP} E(r_{OP}) + w_{GS} E(r_{GS}) = (0.9 \times 0.67) + (0.1 \times 0.42) = 0.645\%$

ii. $Cov = r \times \sigma_{OP} \times \sigma_{GS} = 0 \times 2.37 \times 0 = 0$

iii. $\sigma_{NP} = [w_{OP}^2 \sigma_{OP}^2 + w_{GS}^2 \sigma_{GS}^2 + 2 w_{OP} w_{GS} (Cov_{OP, GS})]^{1/2}$
 $= [(0.9^2 \times 2.37^2) + (0.1^2 \times 0) + (2 \times 0.9 \times 0.1 \times 0)]^{1/2}$
 $= 2.133\% \cong 2.13\%$

8. According to the theory advanced in William Sharpe's dissertation, what was the key to a security's returns?

Covariance with market returns.
